BuildPDF Rexxweb.dll function

The contents of this file will be turned into a PDF document - Just
make sure the script BuildPDF.cmd points to this file.
A few points to note:

        o The Font is set to Courier 12.
        o Page size is 8.5 x 11 inches.
        o A page consists of 60 rows by 70 cols.
        o Any line which exceeds this is automatically wrapped.
        o Existing linebreaks are preserved.
        o Preceeding spaces at the begining of a line are included.

          This allows for text formating using getTextFile as the
          courier font is monospaced.

        o Graphics commands can be included. Commands must start at the
          begining of a line and begin with a colon. Remaining data on
          the line will be ignored. All parameters must be supplied.

          :LINE x1 y1 x2 y2 line_size

          _____

          :RECT x y width height line_size [color]

          Colour is a RGB value represented in Hexadecimal form similar
          to that used in HTML. Some basic colors are Black = 000000,
          Orange = 007F00, Blue = 0000FF, red = FF0000, green = 00FF00

          :LABEL font fontsize x y; data
          Valid fonts are Courier, Courier-Bold, Helvetica and
          Helvetica-Bold. Fontsize must be an integer greater than zero.

                This is a label using Helvetica size 16.

          LABEL data can also contain %PAGE, %DATE and %TIME markers for
          substitution with appropriate values:

            This is page 1. Document Produced on 27-06-2002 at 08:00:05 pm

        o You can specify a documents title, subject and author.
        o A line begining with :NEWPAGE will start a new page.
        o To help minimise file sizes group any graphical commands at
          the top of each page by command. This ensures minimal overhead
          within the resulting PDF to describe the page.
